

PRODUCT REQUIREMENT DOCUMENT (PRD)

Feature: "Repeat" — Hyperlocal Micro-Subscriptions for Quick Commerce

Author: Vishwajeetsinh Gohil

Target Role Portfolio: Product Management / Product Analytics

1. EXECUTIVE SUMMARY

"Repeat" is a low-friction micro-subscription product feature enabling quick-commerce users to automate recurring purchases of high-frequency household staples (e.g., dairy, fresh produce, bread) directly from the existing user path. By pairing localized dark store inventory ring-fencing with automated UPI Autopay processing, the feature captures consistent wallet share, drives predictable revenue cohorts, and flattens early morning demand spike stresses on fulfillment centers.

2. PROBLEM STATEMENT

Hyper-fluid customer brand switching patterns in regional quick commerce are highly accelerated by unpredictable early morning stockouts or dynamic tracking delays on essential items during breakfast prep slots (7:00 AM – 9:00 AM). Manually rebuilding identical delivery carts every 24 to 48 hours adds significant cognitive checkout friction, causing drop-offs to local physical micro-vendors or competing instant delivery applications.

3. SUCCESS METRICS & CORE KPIS

- North Star Metric: Order Velocity Frequency per User per Month (Baseline target: Shifting active segment metrics from 4.2x to 8.5x recurring monthly checkouts).
- Core Guardrail Metric: Subscription Stockout Fulfillment Defect Rate (Target threshold maintained stringently at < 0.5%).
- Growth Analytics Expansion: Peripheral Average Order Value (AOV) attachment sizing on automated morning logistics bundles.

4. USER FLOW INTERFACE LOGIC

- Phase 1 (Discovery): Dual-state inline toggle card placed natively inside individual product detail screens and cart checkouts.

- Phase 2 (Scheduling): Flat horizontal custom weekday chip selector allowing targeted micro-delivery schedules (e.g., Mon-Wed-Fri delivery logic).
- Phase 3 (The Core Gate): Mandatory 8:00 PM T-1 Hours push notification text / WhatsApp confirmation trigger giving customers an easy boundary to modify, edit, or pause upcoming delivery weights with absolute trust transparency.
